

pMaxKote

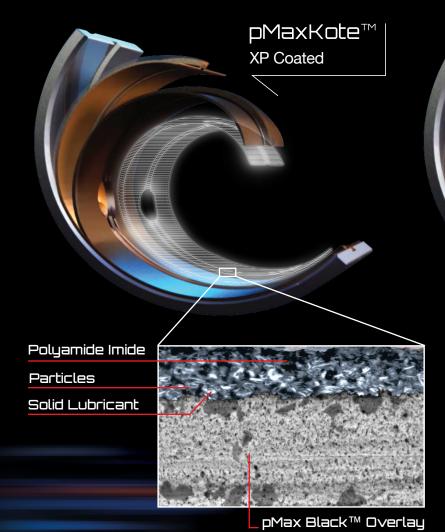

King factory applied nano-composite polymer coating

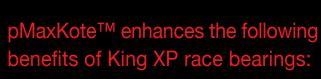

No added thickness!

King's new pMaxKote™ is a nano-composite polymer coating. It is applied over the pMax Black™ overlay at the King factory as part of the bearing manufacturing process. It enhances wear resistance without changing the bearing's original precision wall thickness dimension.

King's pMaxKote™ is a new approach to coated bearings. It has proven to protect bearings during metal-to-metal contact, as well as from the erosive effects of cavitation. It contains ceramic nanocomposite particles that function as a fourth layer which provides superior build protection.

pMax Black™

- Superior seizure resistance
- Superior cavitation resistance
- Superior wear resistance
- Superior protection against oil starvation
